The present sequence encodes mouse Bsk, which is a receptor-like tyrosine kinase. The nucleic acid sequence encoding Bsk can be used in Bsk nucleic acid probes, which can be used in detecting alterations in the level of Bsk messenger-RNA (mRNA) in biological samples isolated from a mammal afflicted with a disease, such as neurodegenerative diseases or disorders and neoplasms. The nucleic acid sequence can also be delivered into the limbic system of patients with limbic system neurodegenerative disease, disorder or injury, to promote or enhance limbic system neuron regeneration or growth. Such neurodegenerative disease include, chromosomal abnormalities, degenerative growth and development disorders, viral infections, bacterial infections, brain injuries, neoplastic conditions, Alzheimer's disease, epilepsy, schizophrenia, or stroke and cerebral ischaemia.

The present invention describes nucleic acid molecules for ror-1, ror-2, ehk-1 and ehk-2. Also described are the corresponding prof Ror-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor tyrosine kinases. The present sequence encodes rat Ehk-2.

Claim 1; Page 57-62; 133pp; English.

CDNAs (T02946-49) coding for 4 novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectively, were isolated from a human foetal brain cDNA library using a directed PCR approach with primers (see T02960-61) based on conserved regions of receptor PTKs and EPH-like receptor PTKs. HEK7, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known when the contained contained for prodn. of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               T02948 standa

PT Agonist antibodies which activate specific protein tyrosine PT Agonist antibodies which activate chimeric proteins of kinase extracellular PT domain and Ig constant domain, useful for studying, and therapeutic PT modulation of, cell growth and differentiation

PS Disclosure; Page 88-92; 125pp; English.

CC DNA probes based on protein tyrosine-kinase (pTK) sequences were used to screen cDNA libraries to identify novel pTK genes. The bpTKs, CC pTK1, bpTK2, bpTK3, bpTK4, bpTK5 and bpTK7 (R85924-28 and R85935, CC respectively) are expressed in human brain tissue and show homology CC to known pTKs. A full-length sequence for the bpTK7 gene (T03100) cc was obtd. This gene may be used to design new drugs, peptides and cc antisense constructs that modulate pTK activity.

PS Claim 1; Page 66-71; 133pp; English.

CC cDNAs (T02946-49) coding for 4 novel human EPH-like receptor protein CC cDNAs (T02946-49) coding for 4 novel human EPH-like receptor protein CC tyrosine kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectively, CC extensive homology to the catalytic domain of chicken EPH-like receptor PTKs and EPH-like receptor PTKs. HEK5, HEK7 and HEK8 show CC extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known CC EPH-like receptor. The isolated cDNAs are used for prodn. of recombinant HEKs and chimeric receptors, in hybridisation assays, and CC to detect abnormalities in HEK receptor genes.

                                                                                                                                                                                               Claim 1; Page 49-54; 133pp; English.

CDNAS (T02946-49) coding for 4 novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectively, were isolated from a human foetal brain cDNA library using a directed PCR approach with primers (see T02960-61) based on conserved regions of receptor PTKs and EPH-like receptor PTKs. HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cck5, Cck7 and Cck8. HEK11 shows no homology to any known EPH-like receptor. The isolated cDNAs are used for prodn. of recombinant HEKs and chimeric receptors, in hybridisation assays, and
                                                                                                                                                                                                                                                                                                                                                         New nucleic acid encoding EPH-like receptor tyrosine kinase(s) and related vectors, host cells, proteins, antibodies etc., used diagnostically and therapeutically to modulate receptor activation
                                                                                                                                                                                                                                                                                                                                                                                                                    Fox GM,

C. CDNA cloning using adult mouse brains and Northern blotting cidentified 2 clones, MDK1 T1 (T32961) and MDK1 T2 (T32962), that coded for truncated versions (W03422 and W03423, respectively) of the novel mouse developmental kinase 1 (MDK1) (see also T32960), a new member of the eck/eph family of receptor tyrosine kinases.

C. MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1 (see also W03421), but lack the catalytic tyrosine kinase domain. They may have a modulatory function. The cDNA clones can be used to produce MDK1 treatment of diseases characterised by abnormal signal transduction. Sequence 2323 BP; 680 A; 497 C; 609 G; 537 T;

                                                                                                                                                                                                                                                                      Example 1; Page 111-12; 128pp; English.

CDNA cloning using adult mouse brains and Northern blotting identified 2 clones, MDK1 T1 (T32961) and MDK1 T2 (T32962), that coded for truncated versions (W03422 and W03423; respectively) of the novel mouse developmental kinase 1 (MDK1) (see also T32960), a new member of the eck/eph family of receptor tyrosine kinases.

MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1 (see also W03421), but lack the catalytic tyrosine kinase domain. They may have a modulatory function. The cDNA clones can be used to produce MDK1 T1 and T2, which are useful for screening potential agents for treatment of diseases characterised by abnormal signal transduction. To isolate the clone, cDNA from mouse embryos was subjected to PCR amplification with primers based on conserved motifs (see also W03426-27) of RTKs. An amplified fragment was used to screen an 11.5-day-old mouse embryo and an adult mouse brain cDNA library to obtain the MDK1 clone. 4 Sequence variants (see also T32961-62 and W03422-25) of MDK1 were also identified. MDK1 nucleic acids can be used for the recombinant produce of MDK1, as probes to detect MDK1, and for the gene therapy of diseases involving abnormalities in signal transduction, such as neurodegenerative and neuroproliferative disorders and cancer.

Novel EPH-related PTK CDNA clone Cek7 (given in 090653) and its variant Cek7+ (090661) were isolated from a chick embryo library in lambda gtl1, and another variant, Cek7' (090662), from a chick embryonic brain cDNA library in lambda gtl1. The variants may originate via alternative splicing of the same gene. Cek7 had the lowest level of expression of 7 novel Eph-related kinases examined and was barely detectable in adult tissues.

Claim 2; Page 44-47; 129pp; English.
Novel EPH-related PTK CDNA clone Cek7 (given in Q90653) and its
variant Cek7+ (Q90661) were isolated from a chick embryo library in
lambda gtl1, and another variant, Cek7' (Q90662), from a chick
embryonic brain cDNA library in lambda gtl1. The variants may originate
via alternative splicing of the same gene. Cek7 had the lowest level
of expression of 7 novel Eph-related kinases examined and was barely
detectable in adult tissues.

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo."
